

What is FARTBOY X doing well

- **Strong, consistent brand voice and original** artwork that stands out in the memecoin feed.
- Community narrative works: posts about IRL meets, “strangers became friends,” and “we rebuilt it” generate replies and tags.
- Amplifying **holders (quoting their poems, videos, or conviction posts)** performs well and feels organic.
- **Partnership posts with visuals and a clear CTA** (discount codes, listings) get above-average engagement.
- **Scheduled-looking cadence** keeps the account visible daily.

What is holding growth back

- Heavy reliance on **similar static-image** + motivational-caption posts. Many follow the **same structure** (“price vs people,” “still here,” “culture over whales”). This risks looking like slop to the model and hitting author-diversity caps.
- Relatively **few videos** despite the current ranking weights favoring video opens, completion, and dwell time.
- Not every post includes a strong **reply or quote trigger**. Some short replies or low-effort posts get almost no distribution.
- **Volume** of similar posts on the same day can dilute performance for any single user’s feed.

How the 2026 X algorithm actually ranks posts

The For You feed now uses a Grok-derived transformer (Phoenix) that predicts the probability of many actions and weights them. **Key signals** as of the August 2026 open-source updates:

- Highest-value positives: **author replies back to comments, replies, quotes, copy-link shares, bookmarks, profile visits, follows, photo expansion, video views/completion, and dwell time** (recently given explicit weight).
- Likes are one of the cheapest signals.
- Out-of-network posts get a 0.75 multiplier; original posts from followed accounts are favored over their replies/reposts.
- Mutuals received an explicit boost in July to make feeds feel more like communities than battlegrounds.
- **Long-dwell and video-open** weights were increased in late August. Immersive videos remain eligible longer.
- Quality/originality matters because the model now “reads” the post. Recycled or low-effort content is filtered more aggressively. Reports, “not interested,” and blocks are heavily penalized.

Recommended posting strategy

Cadence:

Drop from multiple similar posts per day to **1–2 high-quality original posts + active reply engagement**. Quality and reply loops beat volume under the current diversity and scoring rules.

Best times (crypto/Web3 audience):

- **13:00–16:00 UTC** (Europe afternoon + US East morning).
- Secondary: **08:00–09:00 UTC and 20:00–22:00 UTC**.
Tuesday–Thursday tend to be strongest for announcements; weekends still work for community/meme content. Test and double down on what your own analytics show.

Content mix that matches the algo:

- **35–40% original video** (15–90 seconds): community-made clips, Fartboy animations, short music snippets, “day in the life,” partnership recaps, or Discord highlights. Optimize for watch time and completion.
- **30% high-quality image + longer story** posts that invite tagging or sharing (“Tag someone you actually met because of FARTBOY”).
- **20% quote/amplify of genuine holder** content (poems, art, conviction posts). This feels native and boosts mutuals.
- **10% ecosystem/utility updates** (Tangem, BTCC, treasury, charity) with a clear, native CTA.

Tactics that compound ranking:

- End most posts with a **specific question or tag prompt** so replies start immediately.
- **Reply to every meaningful** comment within the first few hours — the author-reply-back signal is one of the strongest in the code.
- Keep **links out** of the main post (put them in a reply if needed).
- Lean into **original, specific stories** rather than generic “we’re still here” lines. The model scores semantic quality.
- **Recycle your own best-performing videos or clips after 2–4 weeks**; older high-engagement video now has retrieval indexes.

What to post more of:

Community-created videos and IRL-meet stories, partnership visuals with utility, short original animations, and quote-tweets of holders.

What to post less of:

Near-identical motivational image carousels and low-effort one-liners. The account already has a distinctive personality and a loyal core. Shifting the mix toward video + reply loops + slightly lower volume of higher-quality original posts should improve both in-network and

out-of-network distribution under the current Phoenix ranking. Track views-to-replies ratio and video completion over the next 30 days and iterate from there.
